## Progress in Research on *Phytophthora* Diseases of Forest Trees

*Phytophthora* (Greek for 'plant destroyer') is one of the world's most destructive genera of plant pathogens. In the early 1990s concern about the increasing impact of invasive and endemic *Phytophthoras* on tree health led to the formation of a new IUFRO Working Group, *Phytophthora* pathogens of trees in forests and natural ecosystems.

Progress in Research on *Phytophthora* Diseases of Forest Trees is the third in a series of conference proceedings from the Working Group. The conference brought together a range of specialist scientists to exchange information on the threat *Phytophthora* species pose to trees, including oaks, alders, beech, chestnuts, cedars, pines, eucalypts and rhododendrons.

- Price £22
- 188 pages with many figures, photos and tables
- Compact disk of 37 poster presentations
