

SIFT Report

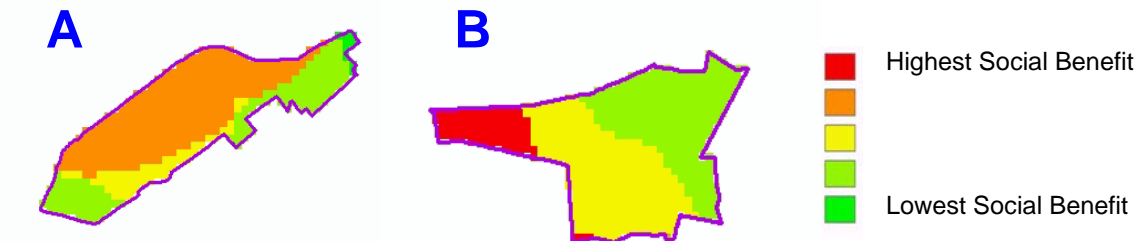

INTRODUCTION

This report helps you identify areas which might provide the greatest social benefit through investment and management of woodland. The information given below should not be used in isolation but should provide a good basis for further analysis on the ground.

The report is split into two main sections.

1. Woodland ranked by the average SIFT score across each candidate area.
2. Woodland ranked by the highest SIFT score within each candidate area.

An illustration of each of these is given below.

A. This area has a good average score across the entire area . In this example there is no particular part that provides the highest possible benefit based on the SIFT criteria but does represent a good social benefit overall.

B. The average score for this area is fairly low due to large parts having low social benefit based on the SIFT criteria. However, there is a significant area (shown in red) which has the highest possible social benefit and this may be a good candidate for further investigation.

In many situations, candidate areas will appear highly ranked in both the average and highest parts of the report and this may indicate an area that is worthy of further investigation. Candidate areas that are highly ranked in only one section may still offer some social benefit and could form part of any further field survey.

The report also shows the area (in hectares) for each of the candidate sites. This may be another important factor to consider when looking at where to target investment.

SIFT Chosen Outcome :-

- Improved health and well-being
- Woodland to benefit people from deprived areas
- More use of woodland for access and recreation
- More woodland based outdoor education (all ages)
- More woodland based outdoor education (Secondary)
- More woodland based outdoor education (Primary)

Candidate sites report

Field headings

Name:	The candidate site name.
Area:	The calculated area of the site in hectares.
Rank – Highest:	This is the rank order of the candidate sites based on the highest score within a particular site. The highest ranking sites (i.e. rank = 1 is the highest ranking site) offer the greatest potential social benefit.
Rank – Average:	This is the rank order of the candidate sites based on the average score across the whole of a particular site. The highest ranking sites (i.e. rank = 1 is the highest ranking site) offer the greatest potential social benefit.
National Grid:	The easting and northing national grid coordinates of centre point of each site.

The following table has sites ordered on the rank of average scores. Sites which appear near the beginning of the list offer the greatest potential social benefit based on the average score across the entire area of each candidate site.

Name	Area - Hectares	Rank - Average	Rank - Highest	National Grid Coordinates	
SIFT_Name	SIFT_Ha	Rank_Mean	Rank_Max	Center_X	Center_Y
Callendar Wood	94.95	1	1	289581	678915
