TECHNICAL NOTE ON SURVEY METHODOLOGY

Sampling and Fieldwork

The Omnibus sample is designed to be representative of the adult population resident in Wales aged 16 and over. The unit of sampling is electoral ward and 68 interviewing points throughout Wales are selected with probability proportional to resident population, after stratification within county (unitary authority).

Within each sampling point, interlocking quota controls of age and social class within sex are employed for the selection of respondents.

Quotas are set to reflect the demographic profile of Welsh residents and no more than one person per household is interviewed. A fresh sample is selected for each survey within substantially the same interviewing locations.

Interviews are conducted face to face in the homes of respondents utilising CAPI (Computer Aided Personal Interviewing) technology. Beaufort's experienced fieldworkers are used with postal and telephone back-checking in accordance with BS7911.

Fieldwork for the March 2007 survey was largely conducted over the period 9th – 17th March 2007 with remaining fieldwork completed a few days after this. A total of 952 interviews were completed and analysed.

Tabulations

The data has been weighted by age group within gender within county council grouping to give each cell (42) its correct incidence within the Wales total derived from the results of the 2001 Census.

Tables are presented in the form of integer percentages with the unweighted and weighted sample base shown at the top of each column. Where the base is anything other than the total sample this is indicated underneath the table heading and follows logically from the question sequence and routing.

Arithmetic rounding to whole numbers means that columns of percentages do not necessarily sum to exactly 100%. Where more than one answer can be given to a question the sum of percentages may exceed 100%. 0 denotes a weighted sample of less than 0.5 and 0% denotes a percentage of less than 0.5%. Where column bases are less than about 50, percentages need to be interpreted with care.

A standard analysis of questions asked is provided as an integral part of the service involving demographic information collected as a matter of course towards the end of the interview. This breaks response down by classification variables (breakdowns) as shown overleaf.
