INTRODUCTION

Method

The information presented in this report was obtained as part of RSGB's General Omnibus Survey for March 1997. Appendix 1 contains a copy of the questionnaire.

Sample

The survey was based on a representative sample of 2000 adults, ie. males and females aged 16 or more. They were selected from a minimum of 130 sampling points - see Appendix 3 - by a random location method, which is described in Appendix 2.

Fieldwork

Respondents were interviewed at home by interviewers organised by SFR's Regional Managers according to RSGB's detailed instructions about the survey and administration procedures. The back checking procedures which were carried out met the requirements of the Market Research Society Interviewer Quality Control Scheme (IQCS).

The interviews took place during the periods 12 - 16 March 1997.

Data Processing

After coding and editing the data, weights were used to allow for sampling variation. The weighting matrix is shown at the end of the tables, before Appendix 1.

TERM OF CONTRACT

No press release or publication of data from this survey shall be made without the advance approval of RSGB . Approval will only be refused on the grounds of inaccuracy or misrepresentation.

NOTES ON TABLES

Tables are usually presented in question number order. The question number and table title are shown at the top of the page.

Percentages are rounded to the nearest whole number. This may cause some mutually exclusive categories to sum to slightly more than or less than 100%.

The sizes of the weighted and unweighted samples on which the figures in the table are based are shown in the top two rows of the table.

If the data have been weighted, the weighted sample sizes are shown in the second row of the table. The percentages will then be based on these weighted sample sizes and all the other figures in the table will also be weighted ones.

The definitions of breakdown columns are shown separately at the head of each column. The total number of respondents within a breakdown is shown, unweighted and weighted, directly below the column title.

The tables show both actual numbers and percentages. These percentages are usually based on the column totals. If the percentages have been calculated by *rows*, then '100%' will appear opposite each row in the TOTAL column.

Any percentages calculated on small bases should be treated with caution as they may be subject to wide margins of sampling error. This is particularly true if the base comprised less than 50 respondents.

“-” indicates a value of zero. “*” indicates a number or percentage less than 0.5.

For open-ended questions, respondents may give more than one answer. When this happens, the percentages representing different responses may well add to considerably more than 100%.

'Nets' or overcodes are sometimes used; these are broader codings, covering two or more of the different responses shown above the overcode. If a respondent has made more than one of these responses, he or she will only be counted *once* in the overcode total, which may thus be less than the sum of the figures for the individual responses.

Where mean scores and standard errors have been calculated, the results will be shown at the foot of the table. If they have been calculated from the answers to a question in the form of a scale, the scores used will be shown next to each row label. When calculating mean scores, 'Don't know' responses are excluded.

1 Q.1 Do you ever use wood as a fuel in your home, either on its
2 own or with other fuels?
3

4 01: YES

5 02: NO

6 DK

7
8 ASK Q.2-4 IF YES AT Q.1. OTHERS TO N.S.
9

10 Q.2 Do you get the wood by the truck load, or a few bags, or
11 gather it yourself?
12

13 01: TRUCK LOAD

14 02: A FEW BAGS AT A TIME

15 03: GATHER FOR SELF

16 DK

17
18 Q.3 Do you use wood as a fuel regularly or only occasionally?
19

20 01: REGULARLY

21 02: OCCASIONALLY

22 DK

23
24 Q.4 Is wood the main fuel for heating your home, or do you mainly
25 use something else?
26

27 01: WOOD MAIN FUEL

28 02: MAINLY USE SOMETHING ELSE

RSGB RANDOM LOCATION SAMPLING METHOD

A unique sampling system has been developed by Taylor Nelson AGB for its own use. Utilising 1991 UK Census small area statistics and the Post Office Address File (PAF), the eligible area of the country has been divided into 600 areas of equal population. The areas within each Standard Region were stratified into population density bands, and within band in descending order by percentage of population in socio-economic Grade's I and II.

To maximise the statistical accuracy of Omnibus sampling, sequential waves of fieldwork are allocated systematically across the sampling frame so as to ensure maximum geographical dispersion. The 600 primary sampling units are allocated to 25 sub-samples of 24 points each, with each sub-sample in itself being a representative drawing from the frame. For each wave of Omnibus fieldwork a set of sub-samples is selected so as to provide the number of sample points required (typically c. 130 for 2,000 interviews). Across sequential waves of fieldwork all sub-samples are systematically worked, thereby reducing the clustering effects on questionnaires asked for two or more consecutive weeks.

Each primary sampling unit is divided into two geographically distinct segments, each containing as far as possible, equal populations. The segments comprise aggregations of complete postcode sectors. Within each half (known as the A and B halves) postcode sectors have been sorted by the percentage of the population in socio-economic groups I and II. One postcode sector from each primary sampling unit is selected for each Omnibus, alternating on successive selections between the A and B halves of the primary sampling unit, again to reduce clustering effects. For each wave of interviewing each interviewer is supplied with two blocks of 100 addresses, drawn from different parts of the sector. Addresses are contacted systematically with three doors being left after each successful interview.

Interviewing is restricted to after 2 p.m. on weekdays or all day at the weekend. To ensure a balanced sample of adults within effective contacted addresses, a quota is set by sex (male, female housewife, female non-housewife); within female housewife, presence of children and working status and within men, working status.
