Manage native broadleaf woodland using a Shelterwood System to allow young native broadleaf trees to become established under the shelter of retained parent trees.

Gradually remove any conifer over the next 30-40 years in a series of operations using a Shelterwood System. Encourage young native broadleaf trees to become established under the shelter of retained parent trees. Leave selected conifer trees in groups or as scattered individuals where appropriate to comprise a maximum of 20% of canopy cover.

Retain conifer woodland in the long term.

Remove 50% of the existing canopy cover.
