

Building research into industry

**In one, easy-to-use information pack,
this publication is a great starting point for all
those who need to know more about converting
wood into energy.**

Woodfuel is news again, attracting fresh attention as a clean and sustainable source of renewable energy.

The **Woodfuel Information Pack** brings together key, basic information about the many aspects of using wood for fuel. These include background on benefits, renewable energy targets and policy; sources; conversion; end users and systems.

The pack is the result of several years' development work by Forest Research and clearly outlines the benefits of using wood as fuel.

Ten individual topics are provided, grouped into four sections and ring-bound in a tough polypropylene cover. This allows for new information to be inserted, and additional topics are already in preparation.

The pack now has a new FAQs sheet, answering the most commonly asked questions about woodfuel.

Ten individual topics
arranged in four sections
Price £10

Background Information

- Woodfuel: introducing the benefits
- Renewable trading systems
- Combustion of woodfuel to produce heat and electricity

Biomass Sources

- Short rotation coppice
- Woodfuel harvesting
- Woodfuel chipping

Biomass Conversion

- Converting biomass to a solid biofuel
- Converting biomass to a liquid biofuel

Biomass User

- Woodfuel end users and associated needs
- Woodfuel heating systems: installation and management
